BREAK AND CONTINUE STATEMENT.

LOOP CONTROL STATEMENTS

PRESENTED BY : ADITYA RAJ, ADITYA, BIDYA SAGAR,
ABDUL BAASIT, AKASH

WORK? HOW DOES A LOOP WORK? HOW DOES A LOOP

INITIALIZATION

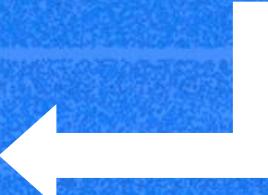

CONDITION CHECK

BODY EXECUTION

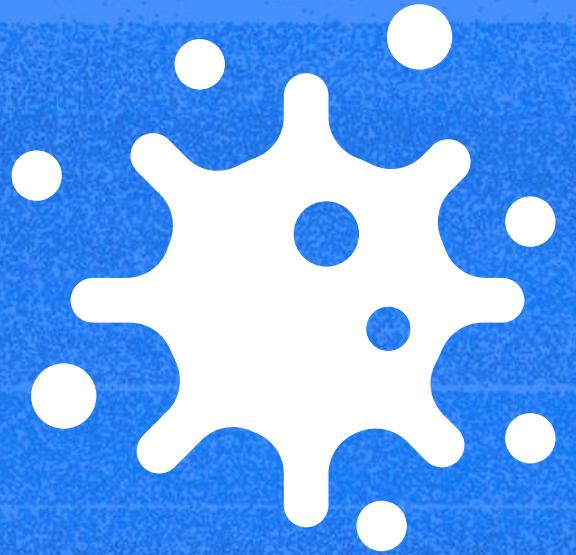

VARIABLE UPDATES

End -

This cycle repeats until the condition becomes false

:(

The BREAK Statement

The **break** statement is used to **terminate the nearest enclosing loop** immediately, regardless of the loop condition.

Example - To stop a search early

● ● ●

```
1 numbers = [10, 20, 30, 40, 50]
2
3 target = 30
4
5 for n in numbers:
6     if n == target:
7         print("Found:", n)
8         break      # loop stops immediately
9     print("Checking:", n)
10
11 print("Loop ended.")
```

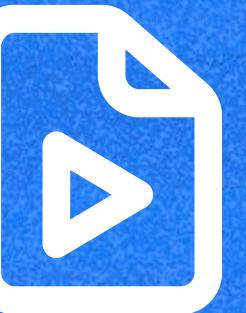

The `CONTINUE` Statement

The `continue` statement is used to skip the remaining statements of the current iteration and move on to the next iteration of the loop

Unlike `break`, `continue` doesn't exit the loop. It only skips one iteration.

Example - To skip unwanted values

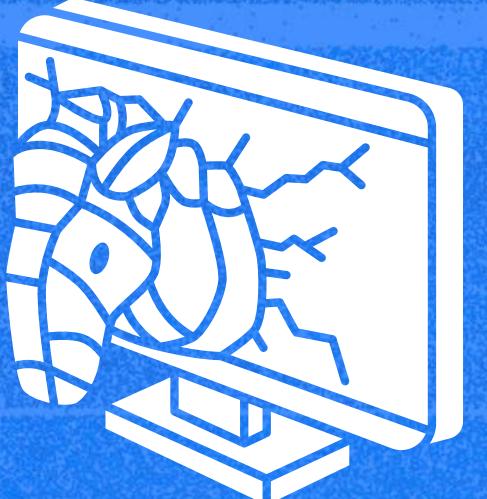

```
1 numbers = [5, -1, 7, -3, 10]
2
3 for n in numbers:
4     if n < 0:
5         continue    # skip this iteration
6     print("Processing:", n)
```

Some use cases:

Use Case	Statement
Stop searching when found	<code>break</code>
Skip invalid inputs	<code>continue</code>
Exit early from test cases	<code>break</code>
Skip processing of unwanted data	<code>continue</code>

Analogy?

BREAK - “Teacher says class is dismissed - everyone leaves immediately

CONTINUE - “Teacher says skip this topic - move on to next topic

:(
:(

Your PC ran into a problem and needs to restart. Anyways THANKS FOR LISTENING, if you have any questions ask away.

103% complete
